How i came up with my talk

I wanted to make useful frontend talk. I came up with my talk and then started to think, what are the most important things that frameworks cover? I would say the following:

- Webpack
- Linting
- Commands and scripts: webpack, babel, sass, git commands.
- Separate codebase for client and server.
- Testing framework. And these are just some of the basics on how i came up with my frontend talk about frameworks.
So i decided to tell you about angular-es6.
